

Certificates

Luz Negra's led profile "easy-ON" system has been certified by Applus for its jagged cover which guarantees water-tightness of IP65 thanks to its double-siphon shape once inserted into the aluminium profile.

This certification is extended to the 29 profiles within our "easy-ON" product group.

European patent

Our profile system with “easy-ON” has been designed and manufactured by Luz Negra in Spain and is protected under patent, hence being granted via Europe an exclusive use.

The “easy-ON” system is the result of continued research, development and innovation which we enforce at Luz Negra.

This system permits you to quickly click the cover on to the front of the profile in a fast and easy manner.

The two jagged edges allow the cover to snap on to the profile in a firm and safe way, achieving a water-tightness of IP65.

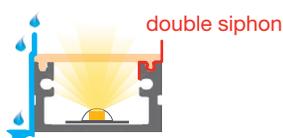

The “double siphon” prevents water and humidity from entering the profile and therefore protects the led from possible condensation and humidity deriving from bathrooms, kitchens, spas, gyms, etc and so extends the working lifespan of the product.

With other systems

As we don't have a double siphon, the water can easily filter inside.

With our “easy-ON” system

The double siphon prevents humidity or water from filtering inside.

Flexible led strip: Infinity series 230V

Screw-on connectors

Ghost profile Sophia 230V

One of our most important new products which we have launched in this catalogue is a set of led strips (Infinity series and Ghost Profile) which work directly at 230V. They are supplied in rolls of 100m (which can be cut every 10cm). This is an extremely high quality product which can function 24 hours in continuous mode. With a very oversized led (it only uses 17% of its capacity) it doesn't get hot even when we use it without an aluminum profile. Its bridge rectifier in each section of 10cm, its IP67 waterproofing (silicone tube filled for greater safety), its large number of leds for better diffusion of the led point (140 leds per metre), its simple connection system (includes screw-on connectors without welding) and its excellent brightness (1500 lumens per metre) all make it the best 230V direct strip on the market. The latter is endorsed with certificates in accordance with the current regulations set forth below:

Certificate CE EMC

Certificate CE LVD

Certificate RoHS

Waterproof DUO for our flexible led "PRO" series

Conventional water-tight systems are composed of one layer of protection and on many occasions humidity can penetrate via capillarisation between the IPC and the silicone layer, hence provoking a short circuit and disabling the led.

The double layer of the waterproof DUO system (designed by Luz Negra) guarantees an optimum water-tightness for all installations, both indoor and outdoor.

There are also other systems which involve completely covering the led strip with glue or silicone at 360°, but these systems increase the width of the IPC from 10 to 12mm (preventing you from inserting in standard led profiles), making them stiffer and decreasing their flexibility.

led strip without waterproof DUO.

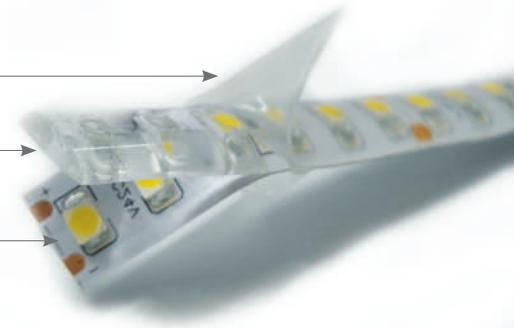

The humidity enters between the IPC and the silicone.

"DUO" System which surrounds the led strip 360°

Silicone 180°

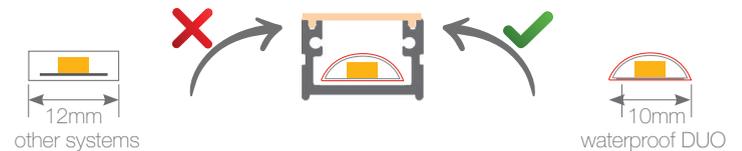

PCB with assembled ledS

Our flexible led strips, Waterproof DUO system, designed by Luz Negra, offer a water-tightness of IP67 yet without having to increase the width of the flexible strip (which is what usually happens with other IP67 strips on the market).

Thanks to this, we can install them in most of the led profiles on the market, whereas the strips with conventional covers increase the width of the strip by 2mm therefore preventing its use in many models of led profiles.

Luz Negra's waterproof DUO is the only water-tight system with IP67 which maintains a width of 10mm and its original flexibility

Flexible led strip with silicone base (without waterproof DUO) IP65

Flexible led strip with "waterproof DUO" IP67

The double cover offered in the Waterproof DUO system means that the light projected by the led collides with two layers (the first one, the silicone and the second, the plastic casing).

This way we achieve greater refraction meaning greater expansion of the light spot, therefore giving out a more homogeneous, diffused light.
